

## Tourism Annex: The effect of climate change on summer tourist season length in North-Western Europe

The maps show the average annual number of very good months (Mieczkowski's Tourism Climatic Index exceeding 70) in northwestern Europe in the climate of the baseline period (1961-1990) and in projected future climates (2010-2039, 2040-2069, 2070-2099). The climate data are taken from an integration of the Hadley Centre HadCM3 model and the IPCC **SRES** A1F and B1A scenarios.
