

## Topic

Future Sea Temperature – Information sheet

## Source

UK Climate Impacts Programme (UKCIP)

## Exec Summary

The UK Climate Impacts Programme (UKCIP02, Hulme *et al.*, 2002) shows potential sea surface temperature (SST) rises around the UK coast under different scenarios of greenhouse gas emissions, with more pronounced warming in the southeast than the northwest. The range of future increase in SST in the southern North Sea is 1.5 – 4 °C by the 2080s whilst that at Rockall is only 0.5 – 2 °C (see figure 1). New scenarios for the UK are currently being developed UKCIP and are due to be launched in autumn 2008. See [www.ukcip.org.uk](http://www.ukcip.org.uk)

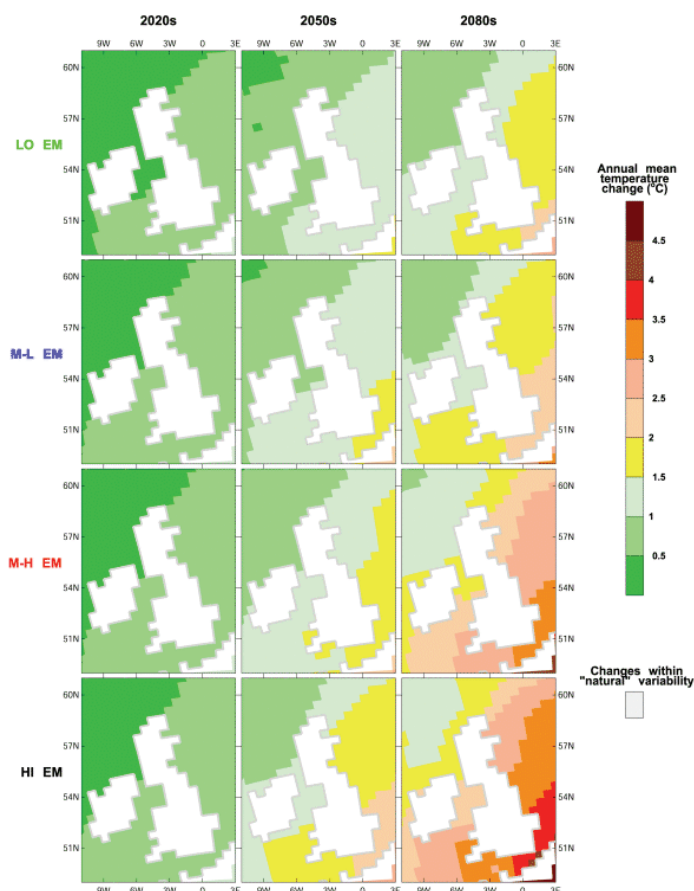

Figure 1: Changes in annual average sea-surface temperature by the 2020s, 2050s, and 2080s (compared to model simulated 1961-1990 average) for four different scenarios of greenhouse gas emissions (UKCIP, 2002)

<b>Confidence assessments</b>
-------------------------------

High confidence that sea-surface temperature will increase around all UK coasts.
